Towards Text Generation with Adversarially Learned "Neural Outlines" NeurIPS 2018

Sandeep Subramanian, Sai Rajeshwar, Alessandro Sordoni, Adam Trischler, Aaron Courville, Christopher Pal

Generative models for text

Autoregressive models - n-gram, recurrent, convolutional, transformer etc.

$$p(x_1, x_2 \dots, x_n) = p(x_1) \prod_{i=2}^n p(x_i | x_{< i})$$

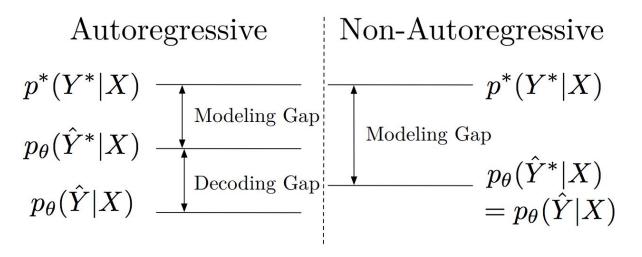

- Conditional probabilities are estimated via counts (n-gram LMs) or parameterized by neural nets and learned.
- They are trained by "teacher forcing" wherein the model sees the ground truth observation at the next time step, independent of what the model may have predicted.
- At inference, the model needs to condition on its own outputs produced greedily (picking the most likely word/char) or by sampling from the softmax.

Potential Issues

 Exposure bias - Ranzato et al. (2015), model hasn't learned to condition on it's own outputs. Remedies (non-exhaustive) include schedule sampling (Bengio et al. 2015), Professor forcing (Lamb et al. 2016) etc.

Model encodes uncertainty over possible generations only in it's output

distribution.

Maybe VAEs?

- Bowman et al. (2015) explore VAEs in the context of language.
- The decoder in the VAE is conditioned on the reparameterized or sampled z.
 Some of the uncertainty in the output is therefore "pre-determined" by z.
- However, they have been notoriously hard to train due to the "posterior collapse problem".
- Although several solutions have been proposed, VAEs are still limited by the simplicity of the parameterization of the prior and posterior distributions.

Advances in sentence representation learning

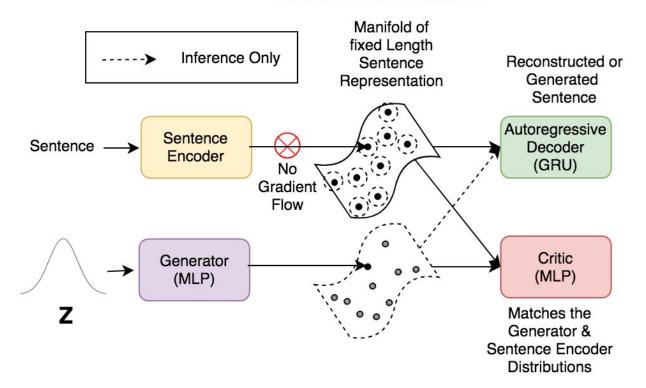

- The latent variable in VAEs doesn't provide enough information to the decoder & the autoregressive signal dominates information from the encoder.
- There have been have been several advancements in representation learning of entire sentences (Kiros et al. 2015, Conneau et al. 2017, Subramanian et al. 2018 etc.).
- What if we interpret general purpose sentence representations as samples from an expressive but unknown prior distribution over a continuous space (from which we cannot sample)?
- By modeling this distribution, we can set up a generative process by
 - a. Sampling a sentence vector or a "neural outline"
 - b. Decoding it to the observed space (words/characters) using a conditional LM.

This work

Questions we're trying to answer

- Can we model the distribution of learned sentence representations?
- Does that help us learn better generative models of text?
- Can we use this to learn generative models of text directly in the latent space?
- Since the representations are continuous and fixed length, can we use generative adversarial techniques?
- Can we produce meaningful interpolations between sentences in a latent space that doesn't have a simple prior distribution?

Model Architecture

Modeling the distribution of sentence embeddings

- Given a corpus of text, we can encode every **sentence** to \mathbb{R}^{2048} using the sentence encoder.
- Learn a generator (MLP) that maps a random vector (drawn from a simple prior distribution) to one that looks like a sentence embedding.
- The generator is trained adversarially using the Wasserstein GAN (WGAN)
 objective with gradient penalty (GP) using an MLP as the critic.

Decoding sentence embeddings to words

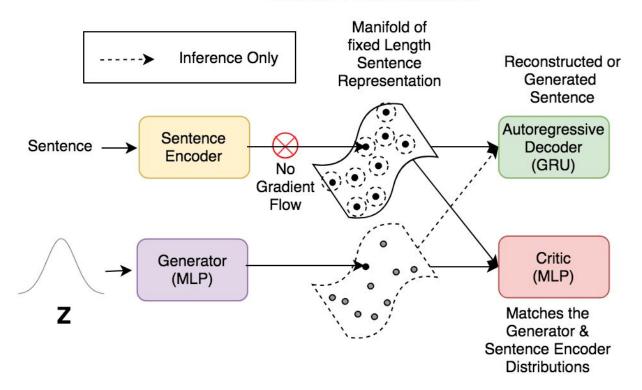

Idea

- Given a sentence embedding, we'd like to reconstruct it's contents to complete the generative process.
- We train an autoregressive (standard) conditional language model that is trained to reconstruct the words in the sentence embedding.
- Can be seen as a sequence autoencoder with a fixed encoder.
- Language model training is independent of GAN training.

Importance of adding noise

- We inject gaussian noise into the sentence embedding before reconstruction.
- This locally smooths the manifold so the GAN has a "larger target to aim at".

Model Architecture

Evaluations

What would we like from our generative model?

- Sample quality
- Sample diversity
- Not memorizing the training data
- Density estimation :-(

Forward and Reverse Perplexities

Idea

- Reverse Perplexity (RPPL) Train a language model on model samples evaluate the likelihood on real data. (Sample diversity + quality)
- Forward Perplexity (FPPL) Train a language model on data samples evaluate the likelihood on model samples. (Sample quality)

Justification

- In the limit that the approximation language model models the data distributions, we can recover the perplexities in both directions.
- Scales well with bigger data and more samples.

Simple n-gram statistics & Overfitting

N-gram statistics

- The number of unique n-grams can tell us something about sample diversity.
- The number of n-grams in the samples that can occur in a holdout set can help assess sample quality.

Overfitting

- The corpus-level BLEU score between a sample and it's nearest neighbor in the training set can be used to probe overfitting
- Nearest neighbors computed using word embedding average similarity.

Results (Unconditional) - Qualitative

the room was nicely decorated and the two of them were very comfortable and the bathroom was fantastic . all of the information was gathered from the police or the court of justice in the united states . we are working with the elders to tell the story of the ancient egyptian stories of the past . all of our doctors , nurses , and other health care providers have been waiting for me . and this is why it is so important that the health care system be fully understood . this is going to be a good way to get a glimpse of the new york city council . "what 's going on with you?" i shook my head , not trusting myself . i was too tired to think about it . "yes ," he said , nodding . in the mid-1980s , he was appointed as a member of the court of human rights in afghanistan . do you have any other ideas about cooperation between the european union and other countries in the world? secondly , i am not happy to see that the countries of the european union are in agreement . the main objective of this study is to promote the development of a more comprehensive and accessible information society . we've been looking forward to welcoming you to the beach , with a view of the sea . but it is clear that the west and east of the country are not yet fully committed . i would like to point out to the house that there are some amendments to the fisheries act . health and education , research and development are a major factor in the development of health education programs . i therefore ask the commission to cooperate fully with the commission and to parliament to approve this report . i hope that the next step will be to ensure that this agreement is maintained in the eu .	100		
we are working with the elders to tell the story of the ancient egyptian stories of the past. all of our doctors, nurses, and other health care providers have been waiting for me. and this is why it is so important that the health care system be fully understood. this is going to be a good way to get a glimpse of the new york city council. Interpolation with gradient-based optimization

- Given two sentences x_1 and x_2 , we formulate interpolation as a gradient based optimization problem that iteratively transforms x_1 into x_2 .
- Let h_{x_1} be the sentence representation of x_1 .
- We interpolate by taking gradient steps along h_{x1} in order to reconstruct x₂.
- We start the optimization process at $h_0 = h_{x1}$ and take gradient steps as follows.

$$h_t = h_{t-1} + \alpha \nabla_{h_{t-1}} \log P(x_2 | h_{t-1})$$

 The probability of reconstruction is given by a fixed and train sentence representation decoder.

Comparison to linear interpolations

1	of course, i had already made coffee and she headed right for the pot.	of course, i had already made coffee and she headed right for the pot.
2	of course, she had already made coffee.	of course, i had already made coffee and she headed right for the pot.
